UNITS AND ABBREVIATIONS

The following names, terms, and units commonly used throughout this report are defined here and when first used in the text.

AF	acre-feet
CVP	Central Valley Project
cfs	cubic feet per second
DOI	Delta Outflow Index
DWR	Department of Water Resources
DO	dissolved oxygen
EC	electrical conductivity
ft	feet
California Aqueduct	Governor Edmund G. Brown California Aqueduct
Banks	Harvey O. Banks Delta Pumping Plant
Kv	kilovolt
KW	kilowatt
KWh	kilowatt-hour
MW	megawatt
MWh	megawatt-hour
µg/L	micro grams per liter
mg/L	milli grams per liter
mmhos/cm	milli mhos (Siemens) per centimeter
PGE	Pacific Gas and Electric Company
SCE	Southern California Edison
SWP	State Water Project
SWRCB	State Water Resources Control Board
USBR	U.S.Bureau of Reclamation
D-1485	Water Rights Decision 1485

MAP 1
FIELD DIVISION BOUNDARIES

Introduction

The 1989 Annual Report of Operations for the State Water Project (SWP) is divided into eight parts. The first two parts, "Introduction and Highlights of 1989 Operation" and "Project Status in 1989," cover conditions and events of state-wide significance. The following four sections cover water quality, water conditions, water operations, and energy operations in 1989. The seventh part, "Sacramento-San Joaquin Delta Operations," gives special emphasis to Delta operations, a key aspect of the SWP. The last part, "Project Operations By Field Division," provides further detail on operational conditions and activities by field division.

The report also includes two appendices, tabulating and depicting Project operations in 1989. Appendix I covers operations of the Aqueduct. Appendix II covers various types of water quality measurement analyses for selected stations throughout the Project.

Highlights of 1989 Operation

Total precipitation was below average for the 1988-89 water year (October 1, 1988, through September 30, 1989) in California. In terms of percentage, precipitation was lowest in the Colorado River area at 38% of average and highest in the North Lahontan area at 112% of average.

The two main watersheds for determining the Sacramento River Index for unimpaired runoff are the Upper Feather River and Lake Shasta areas. Unimpaired runoff to Lake Oroville was greater than that of the 1987-88 water year for all months except December, January, and August. Unimpaired runoff to Shasta Lake was 5.0 million acre-feet (AF) for the year (about 80% of average).

The Department of Water Resources (DWR) and the United States Bureau of Reclamation (USBR) declared balanced water conditions in the Delta six times during 1989: from January 5-8, January 23-24, January 31 - March 4, May 7 - September 18, October 6-26, and from October 31 through December 31. This was the sixth consecutive year, and the eighth of the ten years in this decade, in which balanced water conditions were declared. Balanced water conditions exist when upstream reservoir storage releases, plus other inflows, approximately equal the water supply needed to (1) satisfy Sacramento Valley and Sacramento-San Joaquin Delta in-basin needs, including Delta water quality requirements, and (2) meet export needs. During balanced water conditions, DWR and USBR adjust their reservoir storage releases and Delta exports to enable each agency to meet its share of in-basin uses and Delta outflow.

There are eighteen pumping plants within the SWP. The combined pumping for the year totaled 18,219,965 AF, including 2,672,838 AF of Federal pumping, 15,165,431 AF of State pumping, and 381,696 AF at Castaic for the City of L.A. Plants

used for Federal pumping are Banks, Gianelli, and Dos Amigos. A detailed list of all project pumping is shown in Table 1 on page 2.

Total State contract deliveries in 1989 were 3,156,490 AF; including 2,853,747 AF of entitlement water and 302,743 AF of other water. Total Federal and prior water right deliveries are shown on Map 2 on page 11. See the table below for a breakdown of contract deliveries in 1989:

Entitlement Water in AF		Other Water in AF	
Municipal	1,165,933	Federal Wheeling	173,129
Agricultural	1,052,699	Purchased	71,398
Municipal Ground Water	228,814	General Wheeling	33,958
Bypass	189,726	Local Supply	15,597
Carryover	147,489	Recreation	8,543
Transfer	47,800	Vallejo Permit	108
Benecia	11,091	Sales	10
Vallejo	6,165		
Transfer Carryover	2,391		
Agricultural Ground Water	1,550		
Advance	89		
TOTAL	2,853,747	TOTAL	302,743
TOTAL WATER		3,156,490	

Total water conveyed through SWP facilities in 1989, as shown on Table 2, page 12, was the second highest on record at just over 5.2 million AF. This amount includes prior water right and Federal deliveries. The SWP conveyed over 5.3 million AF in 1981. The lowest in the last ten years was 3.1 million AF in 1983.

Energy resources totaled 9,190,207 megawatt hours (MWh). This includes generation of 5,891,740 MWh of energy at SWP locations (see Figure F on page 18). Energy loads totaling 9,190,207 MWh include sales of 1,078,813 MWh and 7,821,408 MWh used to deliver water to SWP contractors (see Figure H on Page 22).

Total City of L.A. 381,696

Total Project: 18,219,965

Project Status In 1989

Project Facilities

SWP facilities in operation during 1989 included: 28 water storage facilities with a gross capacity of 6,768,792 AF; seven power plants with a total output capacity of 1,686 megawatts (MW); 16 pumping plants housing 112 units with a total motor rating of 2,768 MW; and 537 miles of aqueduct.

During 1989, water was delivered from SWP facilities to forty-eight agencies including twenty-six long-term water service contractors and twenty-two other agencies. In addition, SWP facilities were used to deliver a total of 1,476,378 AF of federal water to USBR customers.

Significant Operational Activities

Major outages and operating limitations of SWP facilities during 1989 were:

- In January, several units were returned to service including those at Wheeler Ridge Pumping Plant, Pine Flat Powerplant, and Ira J. Chrisman Wind Gap Pumping Plant.
- Continuing through the month of February, Thermalito Pumping/Generating Plant Units 1 and 2 remained out of service for stator rewinds. These outages reduced Southern California Edison's (SCE) share of Oroville Complex entitlement
- On February 26, Reid Gardner Power Plant Unit No. 4 was returned to service after an outage that began on January 30 for preventative maintenance and connection of the new cooling tower.
- Energy transmission south to north on the Pacific Gas & Electric Company (PGE) system between Midway and Los Banos substations continued to be curtailed by approximately 50 MW during off-peak hours in March. This transmission restriction severely constrained SWP operations during off-peak hours. Pumping adjustments were made as needed and exchanges were received from PGE during off-peak hours to help relieve the impact of this restriction.
- In March, DWR took delivery of exchange energy from Bonneville Power Administration (BPA) during on-peak hours to be returned to BPA by September 30, 1989. In addition, DWR

purchased energy from several northwest utilities and from PGE during on-peak hours. (A detail of all energy purchases is shown on Figure F on page 18) This energy was needed to support on-peak pumping requirements and meet firm energy commitments.

- Other significant events in March included the de-watering of the Santa Ana Pipeline to repair cracks, the closure of the Delta Cross Channel gates to minimize cross-Delta movement of Salmon, and the return to service of Unit 11 at A.D. Edmonston Pumping Plant that had been out since July 13, 1987, for a complete overhaul.
- In May, September, and October, water was bypassed around Thermalito Powerplant to meet electrical system capacity commitments from Edward Hyatt Powerplant.
- On May 12, two hundred people attended the renaming ceremony of the San Luis facilities to B.F. Sisk San Luis Dam and William R. Gianelli Pumping Generating Plant.
- Preliminary testing of the Automatic Generation Control (AGC) system began during June. This new system will allow DWR to meet the requirements of a single electric utility control area.
- The transfer of 200,000 AF of water purchased from the Yuba County Water Agency's (YCWA) New Bullard's Bar Reservoir by DWR was completed in 1989.

Water Quality Standards

SWP and Sacramento-San Joaquin Delta water quality conditions are summarized below. Detailed water quality reports appear in Appendix E to Bulletin 132. They are also published separately as Water Operations in the Sacramento-San Joaquin Delta, and in DWR's monthly SWP Operations Data.

Water quality and SWP operations in the Delta are governed by the State Water Resources Control Board's Decision 1485 (D-1485). This water rights decision protects beneficial uses of Delta water by establishing water quality standards, which are based on the water year type. Under the Sacramento River Index (formerly the Four-Basin Index) of D-1485, the 1988-89 water year was classified as "dry" for fish and wildlife needs and "below normal" for agricultural, municipal, and industrial needs.

The Delta Outflow Index (DOI) is a calculated approximation of the Delta freshwater outflow past Chipps Island near Pittsburg. The average Delta outflow was only about 5,600 cfs during January and February, due to subnormal precipitation. In 1989, the highest average monthly DOI value (34,309 cfs) and the highest daily DOI value (64,709 cfs) occurred in March. Abnormally dry conditions during the following months gradually decreased flows. The lowest average monthly DOI value (3,571 cfs) and the lowest daily DOI value (about -931 cfs), both occurred in October. Late October precipitation, twice the normal level, resulted in increased flows, with DOI levels averaging about 5,700 cfs during November and December. (See Figure J on page 27.)

During 1989, the SWP met all D-1485 mandated standards for minimum flow in the Delta. A sampling of electrical conductivity (EC) data at various SWP locations is shown on Figure B on page 6. Figure I on page 26 summarizes water quality conditions monitored by DWR at key locations throughout the Delta. Also shown are water quality objectives set forth in Article 19 of the water supply contracts. These water quality objectives are based on the expected construction of an efficient cross-Delta water transfer system. During 1989, the SWP water supply contract's Article 19 objective for the percentage of sodium to total salt content was exceeded at all points south of the Delta. The chloride objective was exceeded often in nearly all water south of the Delta. The average monthly totals of dissolved solids,

hardness, sulfates, and boron remained below contract objectives at all locations.

D-1485 salinity standards were exceeded for three brief periods during 1989, despite SWP operational efforts, described as follows:

- The mean daily chloride standard, maximum of 250 mg/L (milli grams per liter) at the Contra Costa Canal intake, was exceeded from February 9-13 (as illustrated in Figure A on page 5), because of high winds and rising tides.
- EC exceeded the 14-day running average water quality standard of 0.45 mmhos/cm (milli mhos per centimeter) at Emmaton by 0.01 mmhos/cm from June 7-9 (as shown on Figure I on page 26), due to high winds and rising tides.
- The 14-day average EC standard at Jersey Island (0.74 mmhos/cm) was exceeded from July 17-29 (as shown on Figure I on page 26). Delta Outflow was operationally increased to help meet the standard. Reducing Delta exports to help meet the standard was constrained by the combination of two factors: (1) the need to deliver water for meeting agricultural demands during the peak irrigation season and (2) the inability to release stored water from San Luis Reservoir to the California Aqueduct, because of a failure at the San Luis Switchyard.

A February 1969 joint agreement between DWR, the U.S. Fish and Wildlife Service (USFWS), and the Department of Fish and Game (DFG) allows DWR to install a temporary rock barrier on Old River during years when fall flows are forecast to be low. This barrier aids survival of migrating salmon and steelhead by increasing fall flows in the lower San Joaquin River and alleviating dissolved oxygen (DO) depression, less than 5 milli grams per liter (mg/L), in the Stockton Ship Channel. The Old River barrier was installed in late September 1989. Three weeks later, DO was above 5 mg/L. The barrier was removed in late November.

A rock barrier on Middle River, constructed under the October 1986 South Delta Agreement, was installed in early April 1989. The barrier, with specific Clifton Court Forebay operations, permits Middle River flows to be stored during high tide for use during low tide, thereby keeping the water

FIGURE A: MEAN DAILY CHLORIDE LEVELS AT DELTA STATIONS
1989

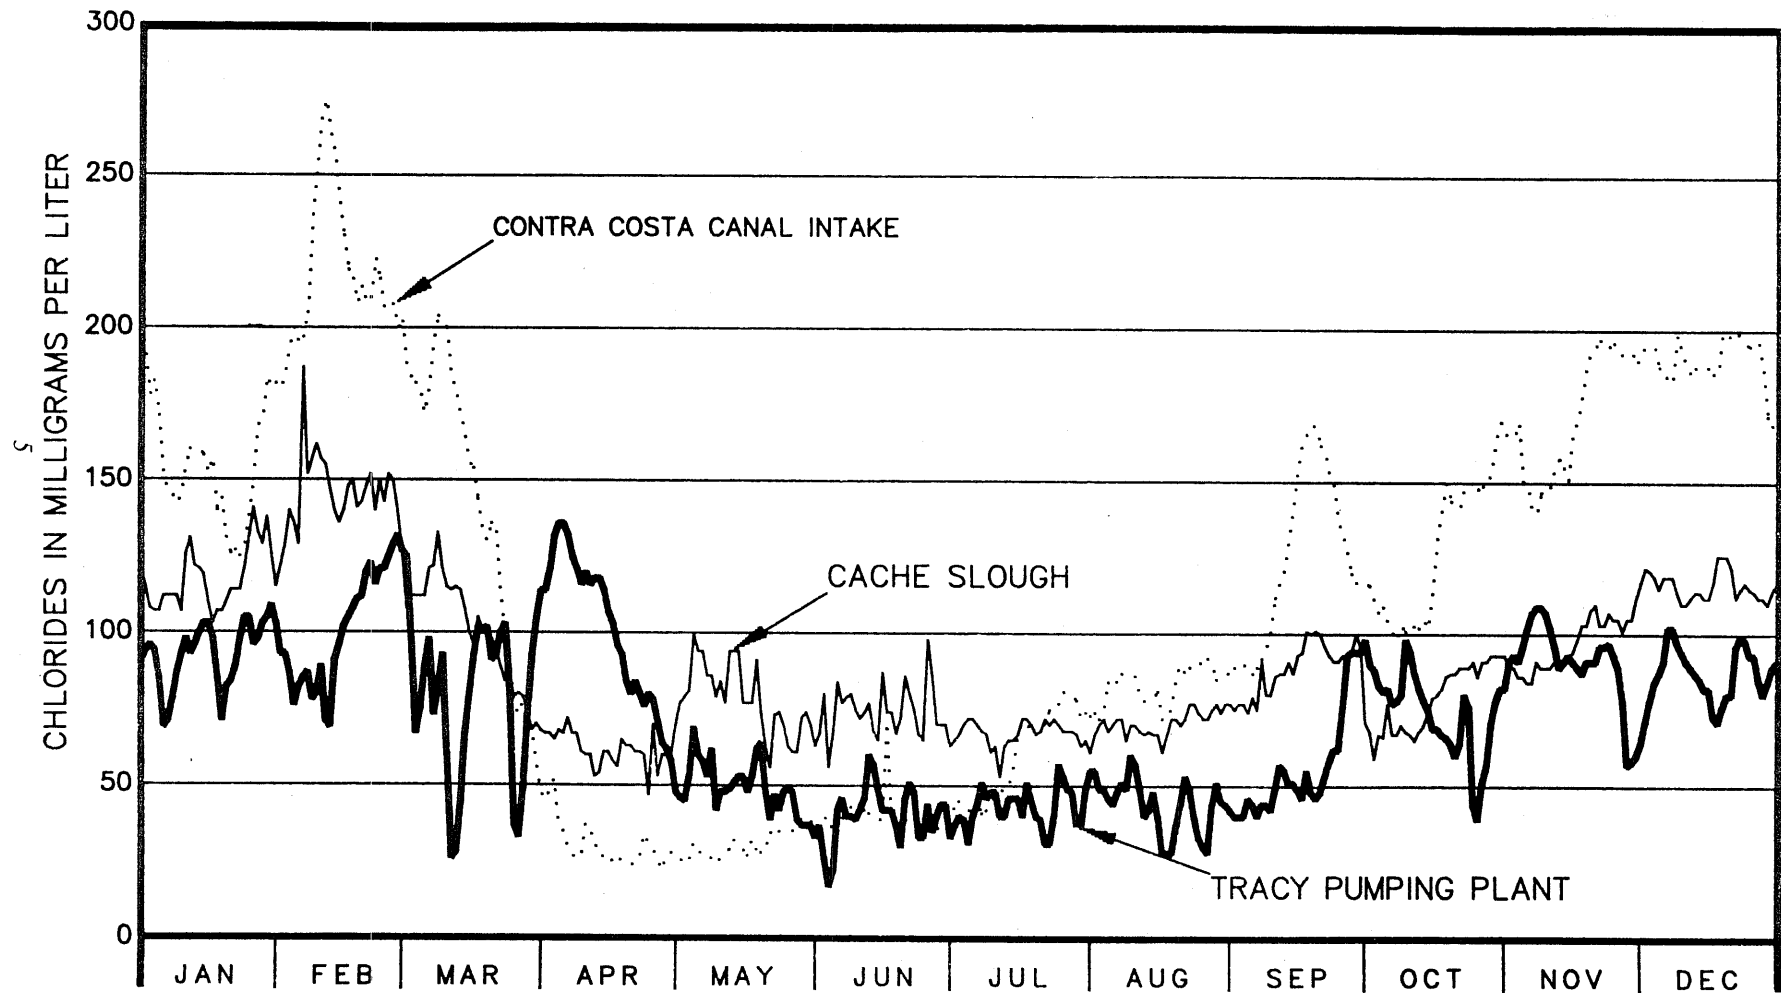

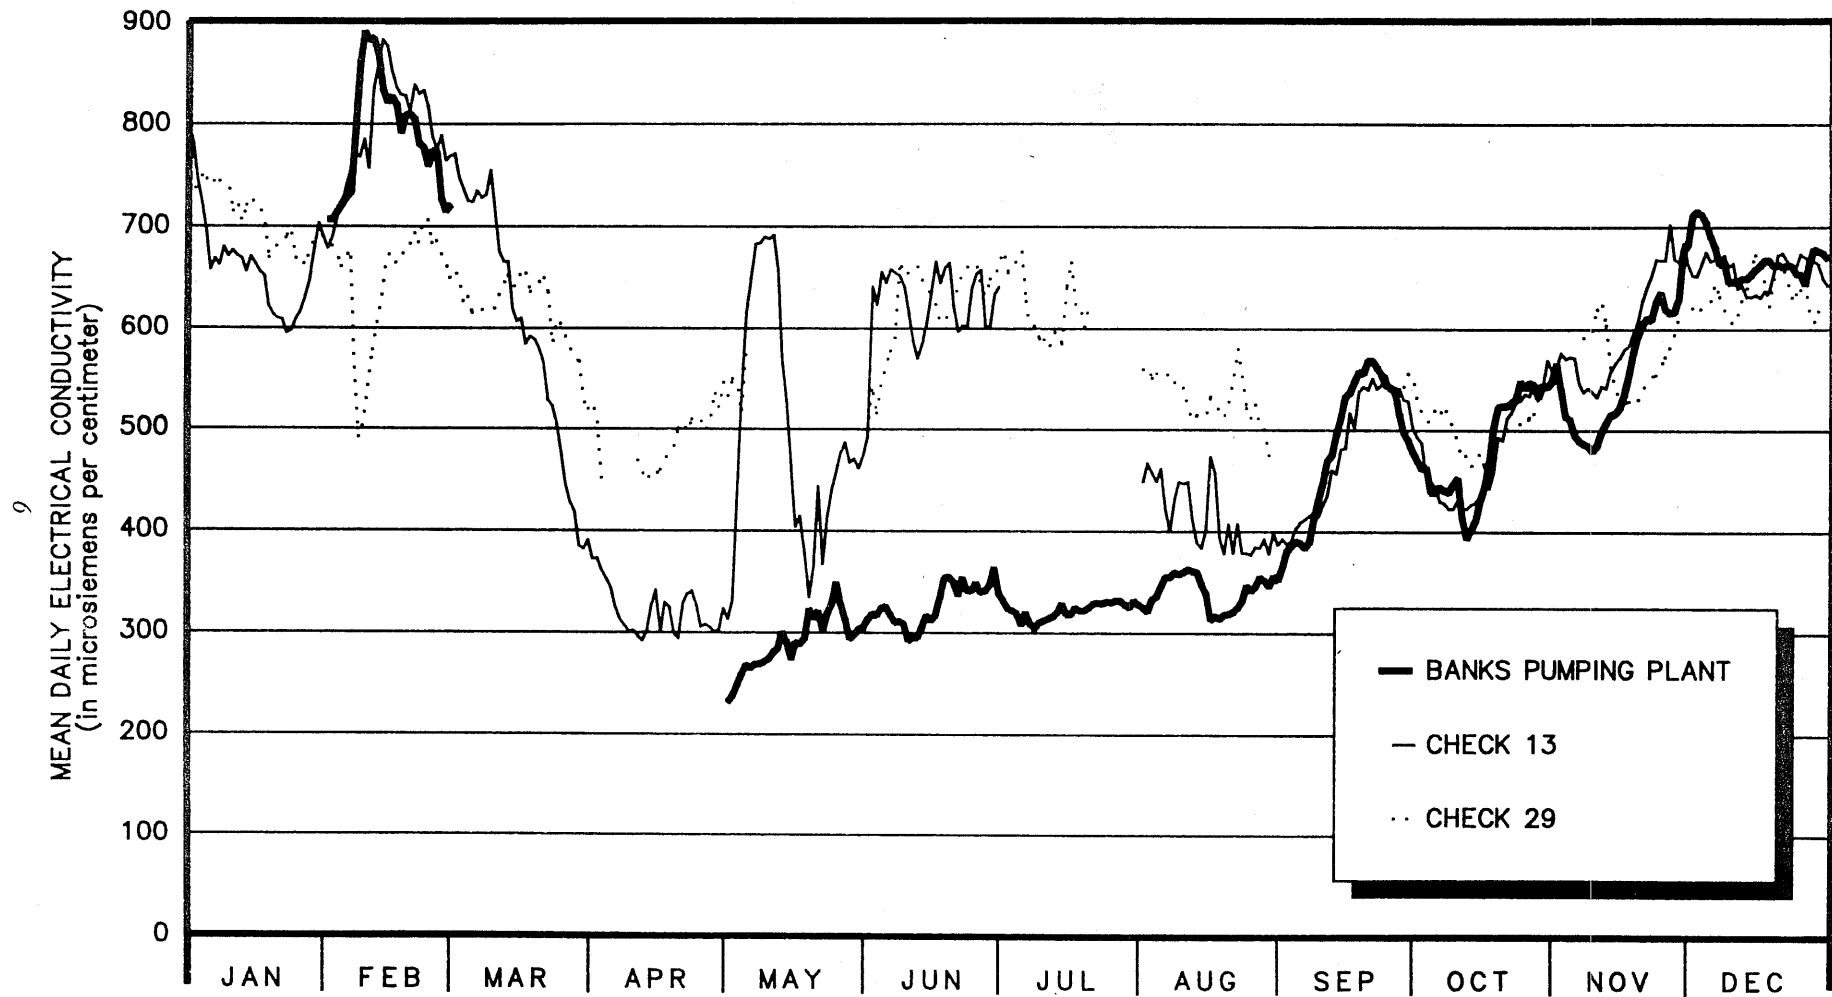

FIGURE B: MEAN DAILY ELECTRICAL CONDUCTIVITY AT SWP LOCATIONS
1989

Note: Missing data points are unavailable because of the replacement of old meters and calibration of new equipment.

elevation of Middle River high enough to allow agricultural water diversion. The Middle River barrier remained in place during the irrigation season and was removed on September 27.

From May 2-9, Clifton Court Forebay gates were closed continuously, reducing exports drastically to evaluate the impact of SWP operational alternatives on the passage of juvenile salmon from the San Joaquin Basin through the Delta. Hundreds of thousands of tagged young salmon were released at locations throughout the Delta and San Joaquin River system with fish flush water (increased Delta outflow) from Keswick Reservoir and Lake Oroville. The tagged salmon, which will be collected in two-and-one half years, should provide information on potential benefits from reducing fish diversions and from installations of partial or full barriers on Old River. Despite the temporary reduction in exports, maximum allowable exports were achieved in May.

In mid-June, testing was conducted to find the relationship between water temperature and salmon survival. Tagged salmon were released upstream under varying temperature regimes and with increased flows from Lake Oroville. Water temperature downstream of Lake Oroville was reduced to 53°F by the third week in June. The recapture of the tagged salmon smolt in two-and-one-half years should help verify temperature modeling.

The striped bass index is used by DFG as an indicator of the number of young bass (averaging 1.5 inches in length) in the Sacramento-San Joaquin Delta. In 1989, the index increased to 5.1 from the 1988 index of 4.6, which was the lowest in 29 years. The striped bass index averaged 66.6 and 24.8 for the years 1958-76 and 1977-87, respectively. Fishery experts continue to investigate possible causes for the decrease in the striped bass population.

Federal and State laws provide for the listing and protection of threatened and endangered species. In 1989, two Delta fish species, the winter-run salmon and the Delta smelt, were listed or proposed for listing. These species have been salvaged from the Skinner Fish Facility near Banks Pumping Plant. DWR is working with the DFG and USFWS to assess SWP impact.

Vegetation surveys were conducted in the central and south Delta during May and November to augment the Department of Food and Agriculture's annual search for the aquatic weed

Hydrilla verticillata. The surveys also documented long-term and seasonal changes in aquatic vegetation. Results showed a stable littoral zone assemblage with offshore margins remaining stable between seasons. The assemblage is predominantly submersed aquatic species, although much of the biomass is composed of the emergent common tule (*Scirpus acutis*) and water hyacinth (*Eichorina crassipes*). *Hydrilla verticillata* was not detected. Concurrent secchi depths (measurements of water transparency) were deeper and water temperatures colder in November than in May.

Besides routine benthic surveys, a special study was conducted with the DFG in Montezuma sloughs and Suisun Marsh to find the extent of invasion by the recently introduced Asian clam, *Potamocorbula amurensis*. The clam is thought to impact striped bass numbers through removal of the zooplankton *Eurytemora affinis*, a primary bass food item.

Operation of the Suisun Marsh Salinity Control Gates at Montezuma Slough decreased salinity during the 1989-90 control season. Operational tests held December 8-15 simulated an opened-gate operational breakdown, which resulted in the rapid decline of water quality. Water quality quickly improved when the normal gate operation schedule was resumed.

From January through May 1989, water quality standards identified in the "Plan of Protection for the Suisun Marsh" were in effect at internal marsh stations (Beldon's Landing, National Steel, and Collinsville). From October through December 1989, EC standards referenced in D-1485 for the internal marsh locations were in effect. No test standards were exceeded in either control season.

The Interagency Health Aspects Monitoring Program (IHAMP) expanded its Delta water quality sampling by adding more agricultural drainage and urban runoff stations at upstream locations. Water samples were analyzed for total and constituent trihalomethane formation potential (THMFP), also for specific minerals, minor elements, and pesticides.

IHAMP, which began in 1983, primarily addresses human health and drinking water concerns in the Delta. The principal focus of IHAMP is the detection of THMFP in Delta water (trihalomethanes are potential carcinogens). Program results showed THMFP values consistently higher at certain agricultural drainage stations than at the channel stations. Agricultural

drainage values were higher in the first six months of 1989 than in the same period of 1988. They also showed distinct peak periods in March and in late summer/early fall for THMFP of bromides. Urban runoff samples from six Sacramento locations showed that THMFP can be nearly as high in urban stream runoff as in agricultural drainage. THMFP values are higher at south Delta locations, partially due to the high organic content of the area's peat substrate.

Other results of IHAMP in 1989 show that sodium levels are well below the recommended drinking water standard (100 mg/L) at the Sacramento River, Barker Slough Pumping Plant, and Middle River stations, and at all agricultural drainage stations except Empire Tract. Sodium levels occasionally exceeded the standard at Banks Pumping Plant and Clifton Court Forebay. Sodium

levels at south Delta locations on the Old River and San Joaquin River system (the Contra Costa Canal and Delta Mendota Canal intake stations) frequently exceeded recommended sodium levels.

Selenium was consistently below the level of detection at most sites sampled and was well below the Environmental Protection Agency standard of 0.10 mg/L where it was detected. Most detected selenium at export locations comes from the San Joaquin River. Selenium levels typically increase during the late fall and winter, when agricultural drainage and ground water seepage make up most of the San Joaquin River flow.

Overall during 1989, the best SWP water quality was found upstream of the Delta and in the four Southern California reservoirs.

Water Supply Conditions

On the basis of criteria in D-1485, the 1988-89 water year was classified as a "dry" year for fish and wild life needs and "below normal" for agricultural, municipal, and industrial needs. The final determination of year classification is made in May, on the basis of current water year forecasts of the "Sacramento River Index" (formerly known as the "Four Basin Index"), which is the sum of the Sacramento Valley's unimpaired runoff at the following four locations: Sacramento River above Bend Bridge, near Red Bluff; Feather River, total inflow to Lake Oroville; Yuba River at Smartville; and the American River, total inflow to Folsom Lake. The May 1 forecast designated the water year as a "subnormal snowmelt" year, because the April through July forecast of unimpaired runoff of 5.34 million AF was less than the 5.90 million AF specified in D-1485.

Actual unimpaired runoff for the 1988-89 water year was 15.0 million AF, only 79% of average. In the Feather River basin, the primary source of water

supply for the SWP, water year total precipitation was 102% of average.

State-wide precipitation, as shown below in three representative hydrographic areas, was below average during the 1988-89 water year.

San Francisco Bay 83% of average
San Joaquin Valley 85% of average
Tulare Lake 83% of average

As of May 1, 1989, the end of California's precipitation season, state-wide precipitation was 80% of average, compared to 82% of average for the corresponding 1987-88 period. Snowpack water content usually increases until about April 1 when melt begins. This year, however, the snowpack water equivalent peaked in early March. Measurements in the San Joaquin and South Lahontan drainages held less than half their April 1 averages. Sacramento Valley water-sheds were only about a third of average.

Water Operations

Reservoir Operations

Lake Oroville and San Luis Reservoir are the two conservation facilities for SWP water supplies. Table 8 on page 34 and Table 12 on page 43 summarize the operations of these reservoirs during the 1988 and 1989 calendar years.

Lake Oroville began 1989 with 727,741 AF less than it held at the beginning of 1988. Storage for January, February, and early March continued to be less than that of the same periods in 1988. However, heavy precipitation and runoff in late March and April brought 1989 storage well above 1988 levels. Storage in Lake Oroville peaked at

3,361,879 AF (96% of normal maximum operating capacity) on May 9 and dropped to 1,888,799 AF (54% of normal maximum operating capacity) by December 31.

The following tabulation compares normal operating capacity in the principal SWP reservoirs with year end storage for 1988 and 1989:

Reservoir	Normal Maximum Operating Capacity	End-of-year Storage 1988	End-of-year Storage 1989
Lake Oroville	3,537,577	1,660,266	1,888,799
Lake Del Valle	40,000	24,532	28,486
San Luis Reservoir*	1,062,000	247,952	616,001
Pyramid Lake	171,196	157,630	157,126
Silverwood Lake	74,970	71,720	56,391
Lake Perris	131,452	115,734	110,247
Castaic Lake	323,702	258,455	216,770
Totals	5,340,897	2,535,289	3,073,820
*State Share			

At the start of 1989, San Luis Reservoir held 43% of its normal maximum operating capacity, although the SWP share was only 24% of its maximum. SWP storage at the end of 1989 was 616,001 AF (58% of maximum State storage), Federal storage was 612,223 for a total of 1,228,224 AF.

At the beginning of 1989, Lake Del Valle held 25,190 AF of water (63% of normal maximum operating capacity). Storage then increased to 37,350 AF (94% of normal maximum operating capacity) on May 22. By December 31, storage in Lake Del Valle was 28,486 AF (71% of normal maximum operating capacity).

SWP southern reservoirs (Silverwood, Perris, Pyramid, and Castaic) held 88% of their combined normal maximum operating capacity at the beginning of the year and held 78% of their combined normal maximum operating capacity by December 31, 1989.

Aqueduct Operations and Water Deliveries

SWP entitlement deliveries for 1989 totaled 2,853,747 AF. A graph showing the annual total deliveries from SWP facilities is shown on Figure C on page 10. The amounts shown by field division on Map 2 on page 11 include the amounts of entitlement water, permit water, local supply,

recreation, purchases, wheeling, and water transfers. Totals by agency are shown in Table 2 on page 12.

DWR operates and maintains the joint-use facilities, including 102 miles of aqueduct between O'Neill Forebay and Kettleman City.

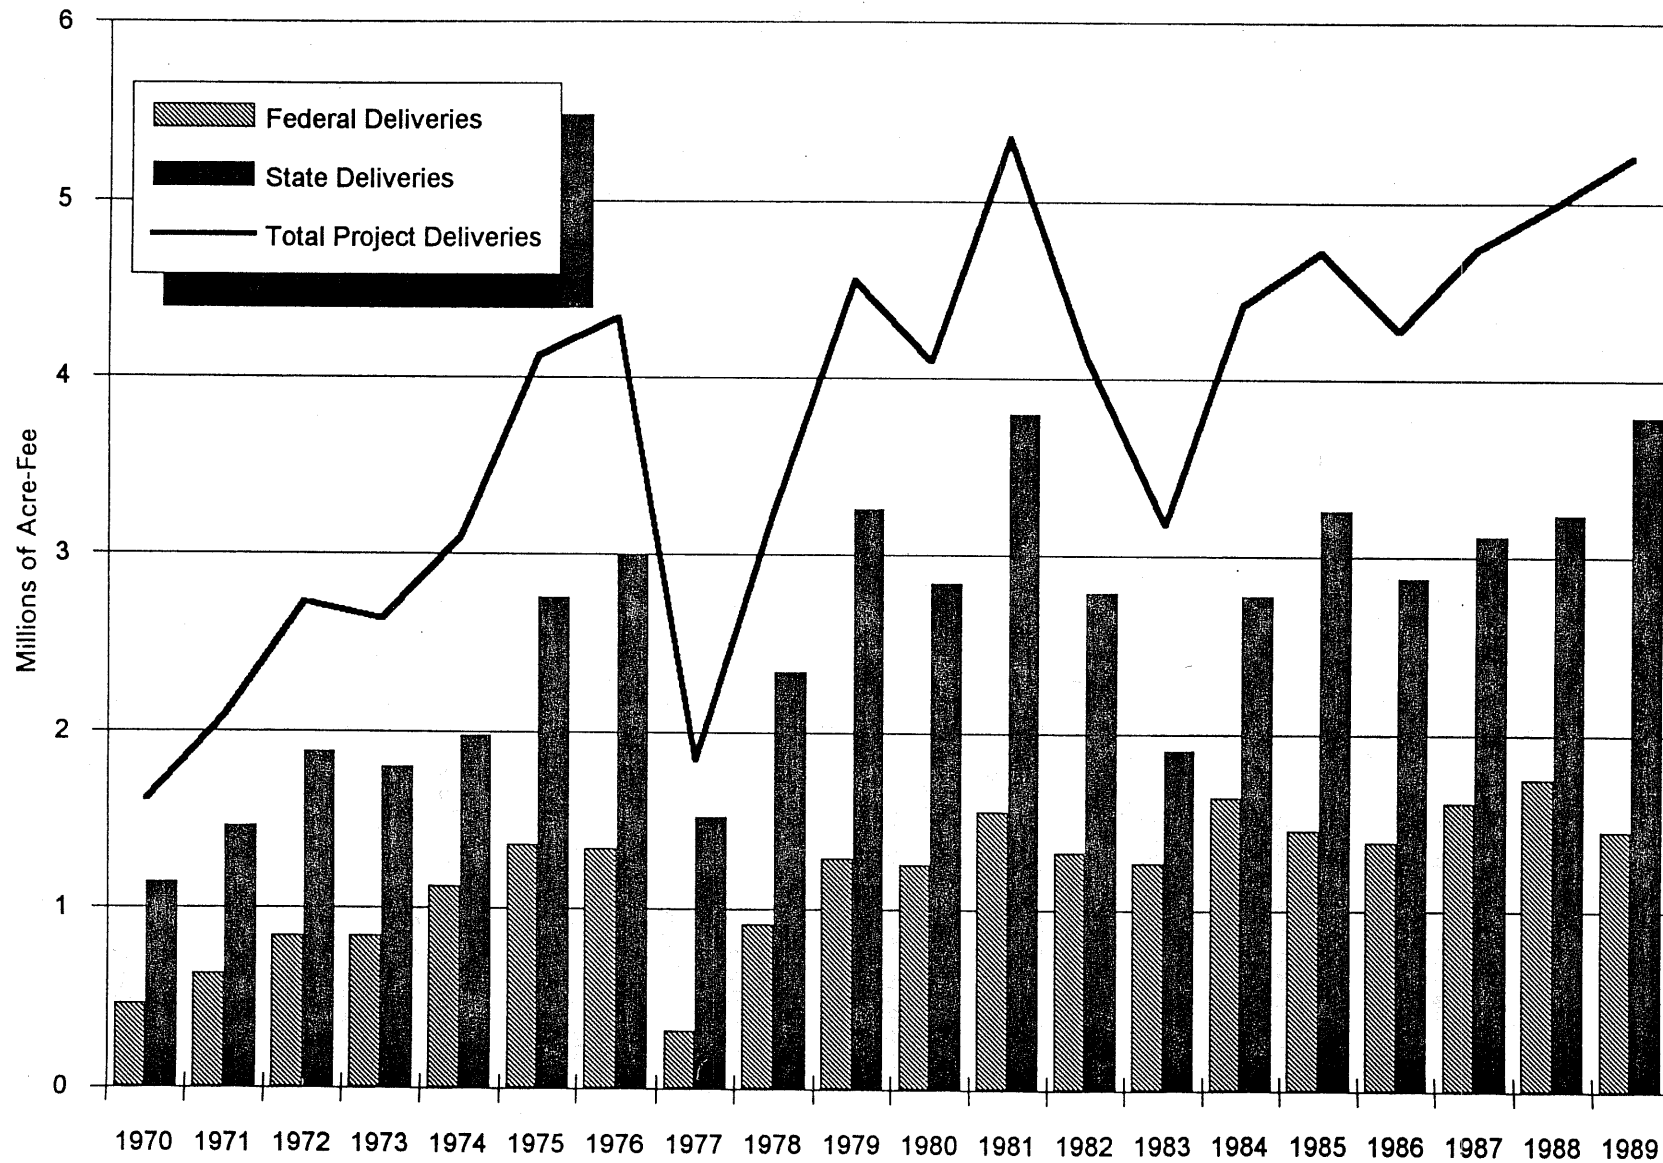

Significant operational activities during 1989 were as follows:

- On February 2, releases from Lake Oroville were increased from 1,200 cfs to 3,700 cfs, and exports from the Delta were decreased to counteract increased salinity in the Delta resulting from high tides. The CVP also decreased exports and increased upstream reservoir releases. Releases from Lake Oroville were gradually reduced from 3,700 cfs to 1,800 cfs beginning on February 25.
- On March 5, the Box Springs Turnout from the Santa Ana Pipeline was dewatered for inspection after seepage was observed above the turnout. The inspection revealed two prominent cracks in the 96-inch-diameter pipe section, one at the valve vault and the other at the meter vault. Crews from The Metropolitan Water District of Southern California (MWDSC) installed temporary internal seals, and the turnout was returned to service on March 10. On March 23, the turnout was taken out of service to replace the damaged pipe and returned it to service on April 6.
- On March 17, MWDSC began refilling the Foothill Feeder out of Castaic Lake. The Feeder had been out of service since December 2, 1988, for placement of 3,000 ft of steel liner in the Newhall Tunnel.
- From May 2-9, the SWP and CVP coordinated their operations to assist the USFWS with the first of two salmon survival tests conducted in the Delta during the year. Both the SWP and CVP curtailed exports from the Delta on May 2 and coordinated upstream water releases to minimize water losses to San Francisco Bay. Because of this salmon survival test, fishery experts hope to determine any benefits that could be achieved by the construction of partial or full barriers at the head of Old River and/or by the installation of a fish diversion facility at the head of Old River.
- In June, DWR and USBR coordinated operations to enhance fish habitat. During the second week of June, Sacramento River flows

1/ Prior water right entitlement.

2/ Hacienda Water District was annexed by Tulare Lake Basin W.S.D. in 1981.

3/ Repayment of preconsolidation water.

4/ Includes 4,300 acre-feet of C.V.P. exchange water.

5/ Includes 45,584 acre-feet of Local-Out.

6/ Includes 1,703 acre-feet transferred to Tulare Lake Basin W.S.D.

7/ Includes 6,500 AF to KCWD., 6,500 AF to Lakeside IWD., and 50 AF to Green Valley WD.

8/ Advance storage of ground water, by agreement between K.C.W.A. and D.W.R.

9/ Includes 324 acre-feet of Local-Out.

10/ Includes 2,500 acre-feet of transferred Entitlement water.

were modified as part of an experiment to determine salmon survival in warm water. During the third week of June, the temperature of releases from Lake Oroville was reduced as part of the modeling verification for salmon survival studies.

- Beginning July 17, the SWP decreased pumping at Banks Pumping Plant and increased releases from Lake Oroville (in coordination with increased releases from USBR's Keswick Reservoir) to meet electrical conductivity standards established by D-1485. Releases were gradually reduced, beginning in early August. Releases from the Oroville facilities decreased from 7,000 cfs on July 17 to 2,500 cfs on August 31.
- On July 25, the transfer of 200,000 AF of water from YCWA's New Bullard's Bar Reservoir to the SWP began. The water had been purchased by DWR for two SWP contractors: Santa Clara Valley Water District, which purchased 90,000 AF, and Tulare Lake Basin Water Storage District, which purchased 110,000 AF.
- During the first week of September, rising salinity levels in the Delta prompted adjustments in upstream releases to stabilize Delta water quality. Releases from Lake Oroville September 9-18 varied from 3,500 cfs to 4,000 cfs. On September 16-18, a heavy storm resulted in excess conditions in the Delta, which allowed releases from Lake Oroville to be reduced. Releases were decreased to 2,500 cfs on September 20 and remained at 2,500 cfs through September 30.
- From October 16-26, Thermalito Afterbay was restricted to elevation 125.00 ft to allow DWR civil maintenance personnel to construct a cofferdam for a new waterfowl brood pond.
- On October 17, 1989, a magnitude 7.1 earthquake occurred near Santa Cruz. SWP facilities were not significantly damaged by the quake. A cooling fan tripped off at Bottle Rock Powerplant, and power generation at Oroville was altered in reaction to high system frequency. Inspections of SWP facilities following the earthquake revealed no situations requiring repair.
- In November, the East Branch of the California Aqueduct was closed and dewatered downstream of Pearblossom Pumping Plant for East Branch Enlargement construction. During this outage silt and debris were cleared from the canal, a section of the Mojave Siphon near Silverwood Lake was lined, the outlet structure of Pearblossom Pumping Plant was modified for the third and fourth discharge lines, and the San Bernardino Tunnel outlet bifurcation was modified to accommodate the enlargement of Devil Canyon Powerplant. Also, pools upstream of Pearblossom Pumping Plant were lowered for Antelope Valley-East Kern Water Agency to install two new turnouts and to convert two existing turnouts from temporary to permanent. The outage ended in early February 1990.
- On November 29, a 10-cfs leak was discovered at mile 35.34 of the South Bay Aqueduct. The Aqueduct was shut down below the Del Valle check, the pipe was dewatered, and a seal was installed inside the pipeline. After the seal cured for twelve hours, the aqueduct was refilled and returned to normal operation.
- On December 1, drawdown of pool 15 to elevation 321.0 was begun to permit construction of a turnout for Panoche Water District at mile 97.46. A coffer dam was then installed around the work area, and the water was returned to the normal minimum pool elevation of 326 ft.

Energy Operations

Energy Sources

Energy generation from SWP's seven hydroelectric plants (Hyatt, Thermalito, Gianelli, William E. Warne, Castaic, Alamo and Devil Canyon) during 1989, totaled 3,778,442 megawatt hours (MWh), as illustrated in Figure D on page 15.

Edward Hyatt and Thermalito Power plants supplied 1,914,185 MWh in 1989, which is 23% above the amount generated in 1988. Generation at Edward Hyatt and Thermalito Power plants is shown in Figure E on page 16.

The combined energy generation at the SWP energy recovery plants (Gianelli, William E. Warne, Castaic, Alamo and Devil Canyon) totaled

1,864,257 MWh in 1989. This is a 20% increase over the amount generated in 1988.

Bottle Rock Powerplant, a 55-MW geothermal plant, began commercial operation on February 26, 1985. The powerplant supplied the SWP with a total of 112,412 MWh in 1989, which is a 21% decrease over the amount supplied in 1988. Reid Gardner Unit No. 4 supplied the SWP with 1,709,195 MWh of energy in 1989, a 5% increase over the amount supplied in 1988.

The future operating level of the Bottle Rock plant is uncertain. Lower-cost energy resources are available and drilling for new steam is uneconomical. If a new entity is not found to take over the plant, DWR may place it in long-term storage. In September 1989, the California Energy Commission began hearings on the unexpected steam decline throughout the Geysers area. DWR is an active participant in the committee set up to investigate the decline.

Under a 50-year contract with the Kings River Conservation District, DWR receives all of the output of the 165-MW Pine Flat Powerplant. The plant furnished 111,200 MWh to the SWP in 1989, a 15% decrease below that furnished in 1988. All SWP energy sources in 1989 are illustrated in Figure D on page 15.

The SWP receives energy under contract from five small hydroelectric facilities (total capacity of 30 MW) owned and operated by MWDSC. In 1989, these plants furnished 177,496 MWh of energy to the SWP. DWR has exchange arrangements with Southern California Edison (SCE) and the Los Angeles Department of Water and Power (LADWP) to provide transmission of this energy.

The DWR-SCE Power Contract has been in effect since April 1983. Under this contract, part of the Hyatt Thermalito Power plants' generation and all of the output of Devil Canyon Power Plant and Alamo Power Plant are delivered to SCE. The energy is generally delivered during on-peak periods and a greater amount of energy is returned during off-peak periods. SCE combined return and additional to the SWP during 1989 was 2,145,493 MWh.

Long term contracted energy purchases such as TERA Corp. and MWD Hydro are itemized separately in Table 3 on page 17. Other purchases totaled 995,168 MWh from various utilities such as Portland General Electric and Idaho Power Co.

Energy Loads

DWR has operated as a bulk power agency since April 1983. As such, DWR uses a combination of owned, contracted, and purchased power resources to meet SWP needs via contracted transmission capacity. DWR also sells and exchanges temporary resource excesses to other bulk power agencies and utilities.

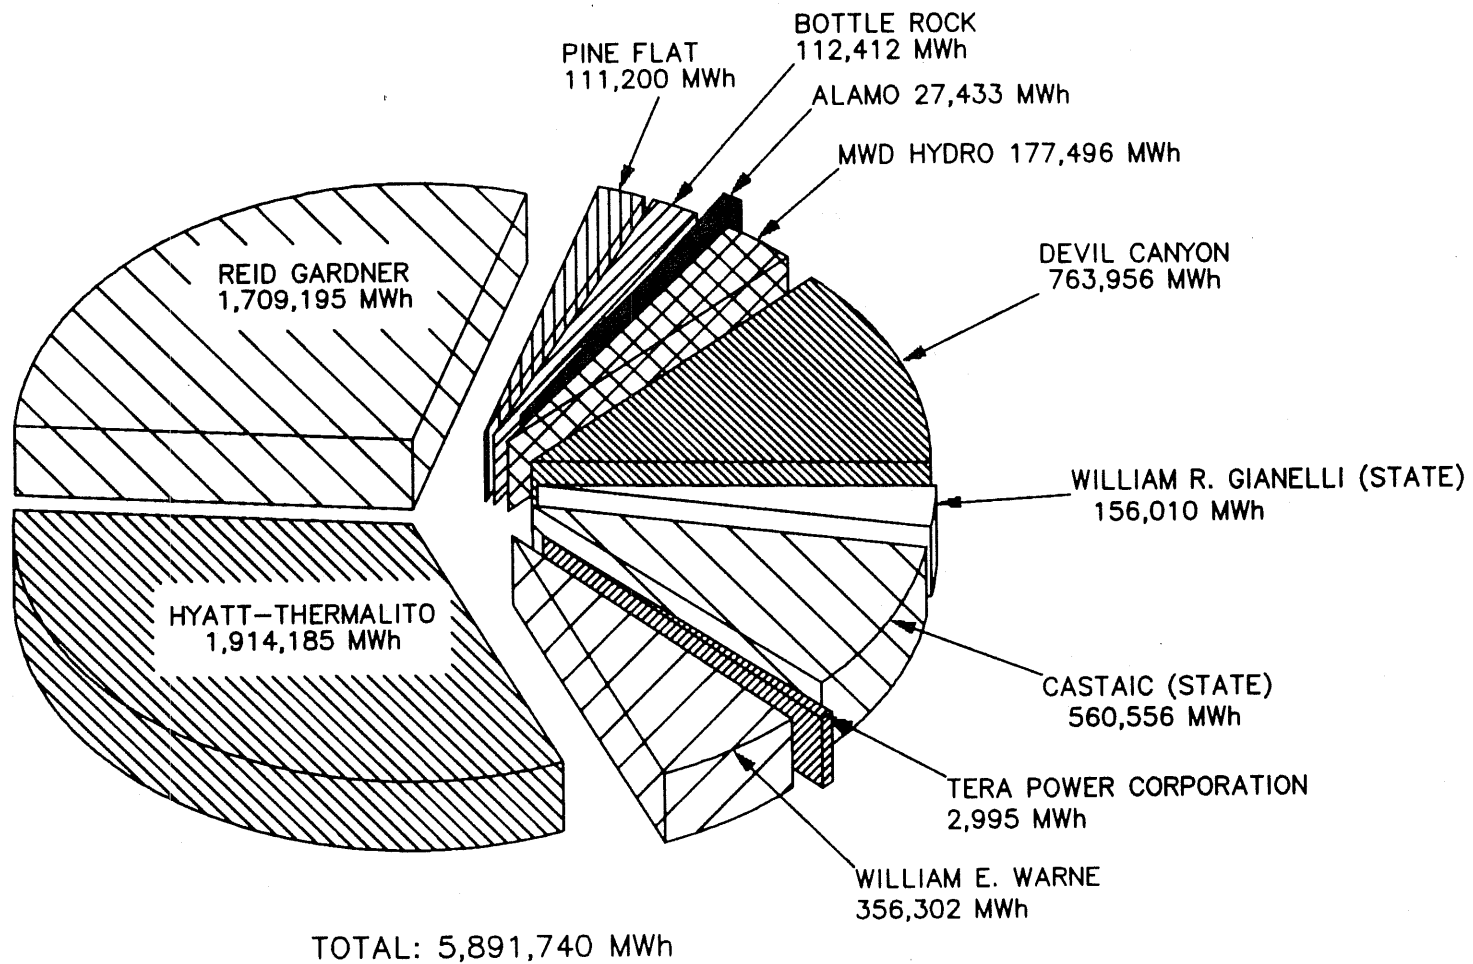

Energy loads during 1989 totaled 9,190,207 MWh, approximately 11% more than the corresponding amount for 1988. This includes 7,821,408 MWh of SWP loads as shown by field division in Figure G on page 20. Also included are losses, sales, and deviation adjustments as shown in Table 4 on page 21. Repayment of transmission losses, through the major transmission networks to the SWP plants, is included as part of the annual SWP energy use at the SWP plants in Figure H on page 22. Increased water deliveries to MWDSC (28% increase), a large pumpback water operation at the Hyatt-Thermalito facilities, and increased pumping at Gianelli Pumping-Generating Plant were the major reasons for higher SWP energy use in 1989. Energy losses on the major transmission line networks in California for the SWP pumping plants and powerplants were 0.28 million MWh in 1989.

Under various water conveyance contracts and exchange agreements, some CVP water is pumped through SWP facilities at Banks, Dos Amigos, Gianelli, and Las Perillas pumping plants. USBR furnishes the energy for this use of SWP pumping facilities.

During 1989, SWP energy supplies (including purchases under contractual obligations) exceeded SWP needs, and DWR sold the excess energy under power sale contracts to fifteen utilities at market rates. The total sale of energy during 1989 was 1,078,813 MWh. In finding the most advantageous time to sell the power, DWR considers projected SWP operations and changes in the power market as well as energy losses, transmission costs, and dispatching costs. System energy loads in 1989 are illustrated in Figure H at the end of this section.

Existing SWP resources together with short-term power purchase contracts, sales contracts, long-term power contracts, and transmission contracts ensure that the SWP has enough energy and capacity to meet future needs. DWR has contracts to sell any excess capacity and

energy, within the limits of the SWP's contractual transmission capabilities, at Malin, Tesla, Vincent, Sylmar, and El Dorado substations.

Also in Figure H, on page 22, is a summary of DWR's power sales in 1989. Total energy sold to fifteen utilities was nearly 1.10 million MWh, for a revenue of \$29.11 million. DWR also received a

total of \$12.86 million in revenues for peaking-capacity payments from Nevada Power Co., peaking-capacity-foregone payments from LADWP, interruptible transmission payments from SCE and the City of Vernon, and capacity payments from Northern California Power Agency, Turlock Irrigation District and the cities of Azusa, Anaheim, Riverside, Banning, Colton, and Vernon.

Sacramento - San Joaquin Delta Operations

Operations of upstream water developments for flood control and water management affect the Delta in many ways. Operation of storage reservoirs such as Lake Oroville alters seasonal flows to the Delta by retaining a portion of the Feather River flow during winter rain and spring snowmelt season for later release during summer and fall to satisfy SWP export and Delta consumptive needs, and to enhance Delta water quality. Flood control operations at Oroville during the winter flood season (October-April) dampen extreme flood peaks, thereby affecting the timing of flood waters entering the Delta.

The Delta is an estuary subject to large daily tidal flows and water level fluctuations. Delta flows reverse direction twice daily from downstream to upstream in response to the immense tidal forces of the Pacific Ocean. SWP and CVP pumping plants are located in the south Delta, an area within these tidal influences. Banks pumps water from Clifton Court Forebay, a 31,260 AF capacity reservoir, into the California Aqueduct.

The Clifton Court control gates normally divert water daily from Old River into the forebay on a priority basis as specified in the 1986 South Delta Water Agency (SDWA) agreement. The SDWA agreement addressed the impact of SWP operations on South Delta water supply, water levels, and circulation. Most Clifton Court inflow occurs during the priority one condition which is from one hour after low-high tide to one hour before low-low tide in order to minimize tidal water intrusion and maintain South Delta water levels sufficient for local agricultural pumping. Table 11 on page 42 summarizes and compares Clifton Court operations in 1988 and 1989. A daily summary of operations (showing actual gate opening and closing times) is published in the monthly SWP Operations Data report.

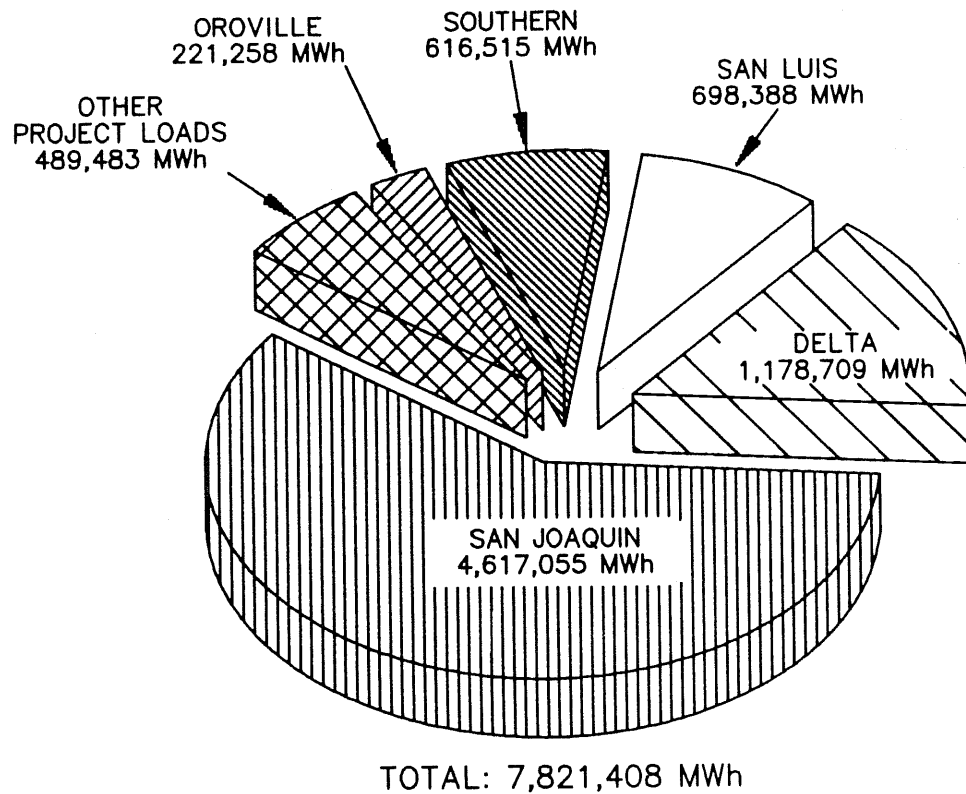

Delta flow patterns are altered by the operations of the SWP and CVP pumps. The

magnitude and timing of the pumping plant impact is conditioned in part by specific D-1485 operational constraints that change with water-year type. When in operation, the SWP and CVP export pumps pull Sacramento River flows southward from the North Delta via the CVP's Delta Cross Channel and through Georgiana Slough. Sacramento River flows not diverted south in the North Delta continue westward to converge with the San Joaquin River near Antioch in the western Delta. During operation of the export pumps, the inner North Delta channel network of sloughs and rivers often cannot carry the water volume for export and Delta consumptive use. When these conditions prevail, the net seaward flow of the San Joaquin River near Antioch can reverse and be pulled southward toward the export pumps. This is known as reverse flow. Under these conditions, export water supplies become more brackish as western Delta water under greater tidal influence is drawn southward toward the export pumps. In order to protect export water supplies during periods of reverse flow, additional water called "carriage water" is released from upstream storage to repel seawater intrusion from the Pacific Ocean. See Table 5 on page 24 for a summary of Delta inflow, uses, and exports.

Balanced water conditions are periods when upstream reservoir storage releases, combined with other Delta inflows, approximately equal the water supply needed to meet Sacramento Valley and Delta in-basin uses, Delta exports, and D-1485 water quality requirements.

In 1989, "balanced water conditions" were declared on six separate occasions; from January 5 through 7; January 23 through 24; January 31 through March 3; May 7 through September 17; October 6 through 25; and October 31 through the end of the year. "Excess flows" conditions were declared after a heavy September storm. This ended the longest stretch of balanced conditions, 136 days, begun four months earlier in May. illustrate various Delta operations during periods of balanced water conditions.

Delta Outflow Index

Direct measurements of net Delta outflow is impractical because of huge tidal flows. However, since net outflow is one of the primary factors in controlling Delta water quality, a calculated value known as the Delta Outflow Index (DOI) has been developed. The DOI represents the daily mean net flow of Delta water into Suisun Bay. Table 6 on page 25 shows the daily DOI for 1989.

Several surface inflows, notably the Cosumnes, Mokelumne, and Calaveras Rivers, and the Yolo Bypass flood control channel, are not included. Furthermore, the precipitation and channel depletion factors in the calculation are based on daily increments of long-term averages, whereas Delta inflow estimates represent mean flows for that entire day. DOI is calculated daily from the sum of Sacramento and San Joaquin River inflows minus gross channel depletion, and water exports by the SWP and CVP. A comparison of Delta Inflow and DOI is plotted on Figure J on page 27. Gross channel depletion is the sum of evapotranspiration and net increase in soil moisture of Delta lands plus evaporation from Delta channels.

Delta outflow during 1989 exceeded 1988 DOI for all months from March through October. March 1989 had the years highest monthly Delta outflow (34,479 cfs) resulting from large winter storm inflow. March rains in the Sacramento basin averaged about 250 % of normal causing seasonal runoff to increase from 40% up to 80% of seasonal average by April 1. March 1989 was the wettest March since 1983 for the area north of the American River with a Delta outflow double the highest previous year's monthly flow (January, 1988).

The months of March and April 1989 were the only months with average outflows over 10,000 cfs. The highest daily outflow occurring on March 28 (64,707 cfs) was augmented by higher end-of-month Oroville reservoir releases, let in part for power production to offset energy purchases for SWP pumping. March had 18 days of Delta outflow over 30,000 cfs, whereas the entire year of 1988 had none.

After mid April, with the return of dry conditions, the DOI exceeded 10,000 cfs for only six days during the remainder of the year, two days

each in May, September, and October. The lowest DOI flows were measured in September and October when negative DOI values occurred with export pumping exceeding river flow for one day in September and three days in October. October 7 had a value of -933 cfs. However, negative values may not reflect actual physical conditions as DOI is not a measured flow but a calculated index.

D-1485 standards set a minimum DOI at Chippis Island for the environmental requirements of young striped bass and for adequate water quality in Suisun Marsh. In 1989, SWP operations augmented the DOI during June, July, and August. The largest monthly augmentation took place in July (3,688 cfs) during peak irrigation season. The largest daily augmentation occurred on August 17 concurrent with drastic curtailment of Delta export pumping in response to rising Delta salinity.

The DOI was reduced during nine months of 1989. In all, SWP operations reduced the DOI a total of 291 days during 1989, about 80% of the time. The greatest reduction of DOI resulted from Oroville reservoir conservation of high March and April storm flow and snowmelt during a period of limited downstream demands. Average March and April monthly flow reductions were 24,034 cfs and 14,460 cfs respectively. The largest daily reduction of DOI occurred on March 12 (74,266 cfs) with rapid reservoir fill.

1/ Time lagged values (Keswick: 5 days; Oroville: 2 days, Nimbus: 1 day).

2/ Positive values are accretions; negative values are depletions.

3/ These values are a measured daily average taken from the Sacramento River at Freeport.

4/ These values are based on daily 6 a.m. readings. Columns 1, 2, 3, 12, and 13 are based on measured total daily flow.

5/ Includes Sacramento County Regional Wastewater Treatment Plant.

6/ Includes any USBR water pumped at Harvey O. Banks Delta Pumping Plant.

Project Operations By Field Division

Oroville Field Division

Water Storage

SWP water storage facilities north of the Delta include Lake Oroville, Thermalito Forebay and Afterbay (Oroville-Thermalito Complex) and upper Feather River reservoirs consisting of Lake Davis, Frenchman Lake, and Antelope Lake. Lake Oroville operations are for storing winter and spring runoff for later SWP use which includes power generation, flood control, recreation, fish and wildlife enhancement in addition to water supply.

The Upper Feather River Reservoirs have a combined capacity of 162,000 AF. Of these reservoirs, Antelope Lake was the only one to spill in 1989. Monthly operations for the three upper Feather River reservoirs are presented in Table 7 on page 33. The table below compares storage capacity with the largest end of month storage for each reservoir for the last five years:

	Antelope	Frenchman	Davis
	(all values in acre-feet)		
Capacity	22,566	55,477	84,371
1989	(May) 23,125	(Apr.) 37,031	(Apr.) 61,015
1988	(Apr.) 16,344	(Apr.) 32,002	(Jan.) 55,043
1987	(May) 19,285	(Apr.) 41,909	(Apr.) 69,815
1986	(Mar.) 23,886	(Mar.) 57,344	(Mar.) 84,250
1985	(Apr.) 23,371	(Apr.) 52,877	(Apr.) 79,462

Lake Oroville's computed inflow is tabulated in Table 8 on page 34 and plotted along with releases and diversions on Figure N on page 35. March's total inflow of just over 1.2 million AF is the highest since February 1986 (which totaled nearly 2.4 million AF). A ten-year historical summary of Lake Oroville's storage and inflow is illustrated on Figure O on page 36. Figure N clearly shows which months (eight for 1989) of the year required withdrawals from storage.

During 1989, inflow into Lake Oroville was insufficient to cause the actual storage to encroach into the lake's "Required Flood Control Reservation" space (see Figure P on page 37). The lake was not operated for flood control, and no water was released from the Oroville Dam spillway.

Water temperature on and below the lake's surface is monitored very closely throughout the year at various locations around the lake. Two intake structures to the powerplant have shutters that control the depth from which water enters the plant. Temperatures of water entering the fish hatchery can

then be controlled by adding or removing shutters as necessary. A complete illustration of water temperature and intake structure operation is shown on Figure Q on page 38.

Water Deliveries

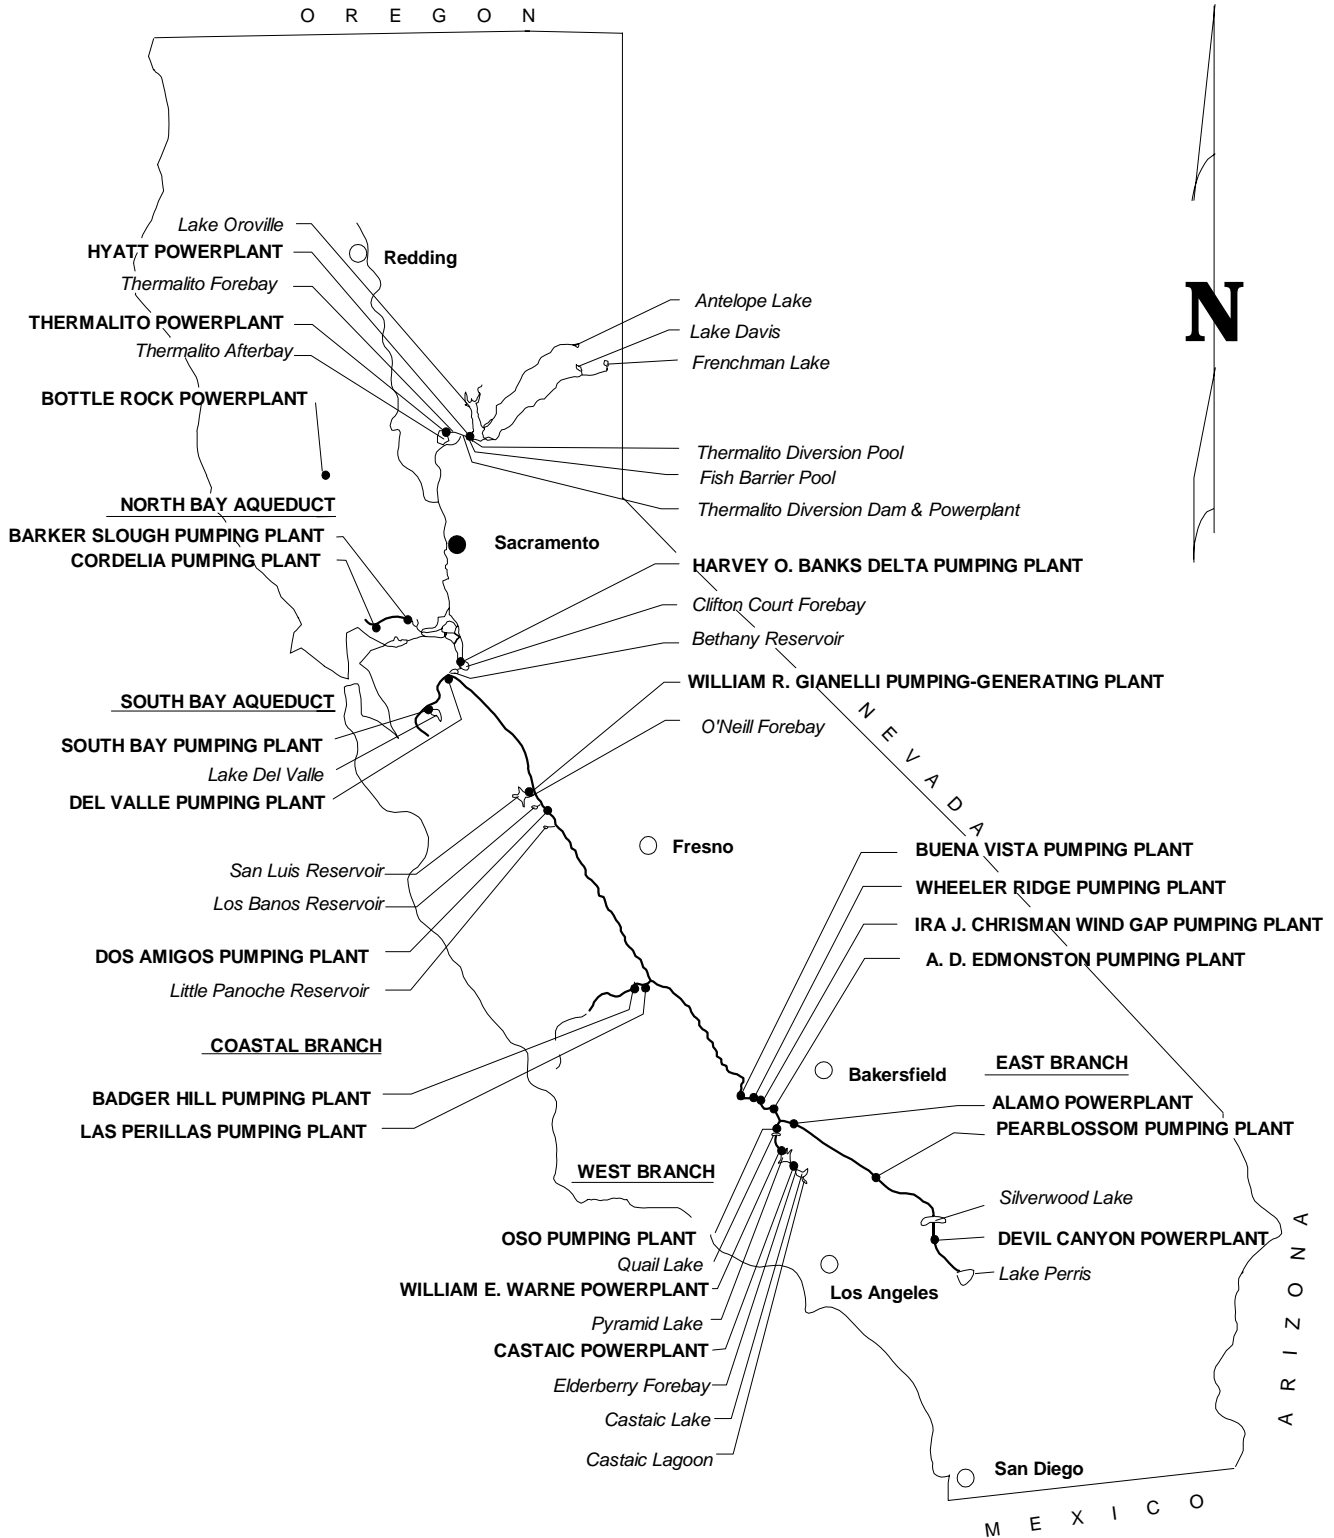

Water conveyed totaled 825,286 AF which includes contract deliveries of 14,828 AF and prior water right deliveries of 810,458 AF. Most prior water right deliveries (as shown below) were made downstream from Lake Oroville except 1,821 AF which was made from Lake Davis. Detailed operations data for all three Upper Feather Area Lakes is shown in Table 7 on page 33.

Water stored in Lake Oroville is released to Palermo Canal and into the Thermalito Diversion Dam Pool, from which specified quantities are released into both the Feather River and the Thermalito Power Canal. The Power Canal supplies water first to the Thermalito Forebay and then to Thermalito Afterbay. From the Thermalito Afterbay, additional water is released to the Feather River and several local distribution systems used to deliver water to prior water right holders. These deliveries are collectively called the Feather River Service Area (FRSA) diversions and flow through the Sutter-Butte, P.G.&E., Western, and Richvale Canal outlets. FRSA diversions are not considered SWP benefits as they predate the SWP construction and would have occurred in the absence of the SWP to the limit of available natural river flows. Nearly all FRSA diversions are for agricultural uses and totaled 808,637 AF in 1989 as shown below:

Sutter Butte	482,053
P.G.&E.	3,784
Richvale	84,746
Western Canal	230,508
Palermo Canal	7,546
TOTAL IN AF	808,637

A comparison of 1989 and 1988 Diversion Dam, Forebay, and Afterbay water surface elevations and storages is presented on Table 9 on pages 39.

Delta Field Division

Water Storage

The Delta Field Division consists of the North Bay Aqueduct, the South Bay Aqueduct, and the California Aqueduct from Clifton Court Forebay to Check 8. Along these waterways, storage change data are maintained for Clifton Court Forebay, Bethany Reservoir, Travis Tank, Napa Terminal Tank, California Aqueduct, and Lake Del Valle. South Bay Aqueduct storage changes are assumed to be zero for operational purposes.

Lake Del Valle, as an off-stream storage facility, normally receives inflows from the South Bay Aqueduct in the spring. Releases back into the Aqueduct usually occur in the fall and are detailed in Table 10 below. Inflow and storage changes for the last ten years at Lake Del Valle are shown on Figure R on page 41.

Project water flows from the Delta into Clifton Court Forebay through the Clifton Court control gates. A schedule of daily gate operation is published in the SWP Monthly Report of Operations. Monthly inflows to Clifton Court Forebay along with corresponding storage changes are shown in Table 11 on page 42.

Water Deliveries

Totaled water conveyed in the Delta Field Division was 195,845 AF for 1989. Entitlement and

Local Supply deliveries totaled 172,111 and 1,958 AF. Federal and Recreation deliveries totaled 473 and 152 AF. Under Vallejo's water right claim, 108 AF of non-SWP water was conveyed to the City of Vallejo's delivery structure. Napa County Flood Control and Water Conservation District took 3,958 AF of non-SWP YCWA water wheeled through the Aqueduct. DWR purchased 17,085 AF of YCWA water and delivered it to Santa Clara Valley Water District. These and other deliveries are summarized in Table 2 on page 12.

Pumping Plants

Delta Field Division pumping plants include Barker Slough Pumping Plant and Cordelia Pumping Plant on the North Bay Aqueduct, Banks on the California Aqueduct, and South Bay and Del Valle Pumping Plants on the South Bay Aqueduct. Monthly pumping data is summarized for the year in Table 1 on page 2.

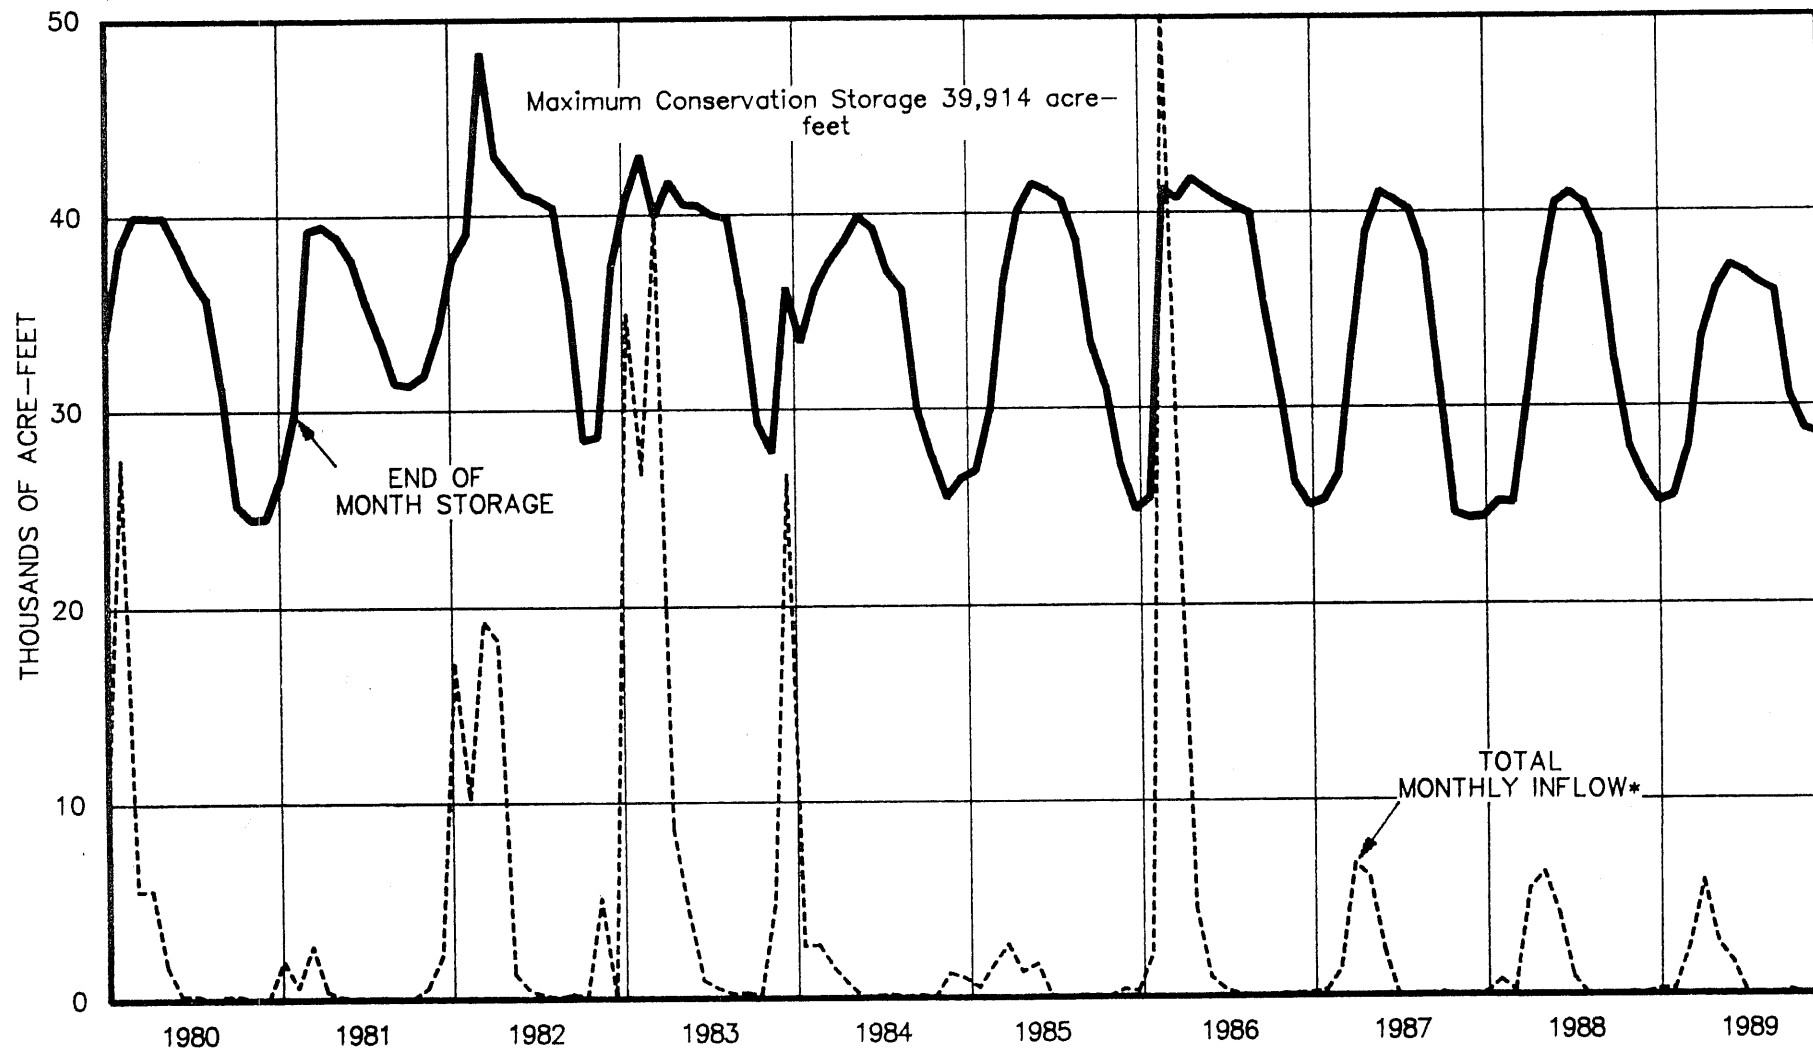

There was 373,209 AF of Federal pumping at Banks in 1989. Below is a five year summary of Federal, State, and total pumping at Banks in AF:

PUMPING AT HARVEY O. BANKS DELTA P.P.			
Year	Federal	State	Total
1989	373,209	3,409,326	3,782,535

San Luis Field Division

Water Storage

San Luis Reservoir total storage reached its maximum of the year, 1,548,016 AF on April 12. Maximum operating storage capacity is 2,027,835 AF. Drawdown to the minimum total storage for the year, 160,927 AF, occurred on August 24. The State's share of San Luis Reservoir storage reached the maximum of 824,005 AF on April 31, while the minimum of 106,720 AF was reached on August 20. Table 12 (below) and Figure S on page 44 show San Luis Reservoir operations during 1989. Table 13 on Page 45 shows the monthly operation of O'Neill Forebay during 1989.

Pumping and Generating Plants

Total pumping in 1989 at Willam R. Gianelli Pumping-Generating Plant was 2,045,447 AF. Total water released from San Luis Reservoir to O'Neill Forebay for generation was 1,455,905 AF. Total pumping at Dos Amigos Pumping plant in 1989 was 4,159,006 AF. Table 14 on page 46 summarizes joint-use plant activity on a monthly basis.

Water Deliveries

Water delivered in the San Luis Field Division during 1989 totaled 1,333,742 AF. This includes deliveries to Federal Contractors totaling 1,302,841 AF; 30,000 AF of independently purchased water from YCWA, conveyed by DWR through the California Aqueduct from Banks Pumping Plant to O'Neill Forebay for waterfowl enhancement; 603 AF of State and Federal deliveries to the DFG and the Department of Parks and Recreation (DPR) from the O'Neill Forebay area (Reach 3). Similar deliveries out of Reach 5 totaled 298 AF. The following tabulation details the components of these recreation deliveries:

O'Neill Forebay (Reach 3)

San Joaquin Field Division

Water Deliveries

A total of 1,579,375 AF of deliveries were made in the San Joaquin field Division in 1989. There were six SWP water service contractors who took delivery of 1,406,719 AF. Water types include entitlement water, transfer entitlement, carryover entitlement, purchases, and transfer water. Kern County Water Agency (KCWA) represented 81 percent of the total SWP water delivered within the Division.

In addition to SWP deliveries, 172,656 AF of Federal water was wheeled through SWP facilities to KCWA's Cross Valley Canal to be delivered to Cross Valley Canal contractors. The table below itemizes Total Wheeling:

FEDERAL WHEELING	
Agency	Agency Total
Cawelo Water District	2,882
Fresno County	3,000
Green Valley Water District	857
Hills Valley Irrigation District	2,639
Kern-Tulare Water District	40,000
Kings County Water District	8,691
Lakeside I. W. D.	13,690
Lower Tule River	31,102
Pixley Irrigation District	43,102
Rag Gulch Water District	13,300
Tri-Valley Water District	885
Tulare County	5,308
USFWS	7,200
TOTAL FEDERAL WHEELING	172,656

Map 2 on page 11 and Table 2 on page 12 break down water deliveries by agency and water type with totals.

The San Joaquin Field Division is the only field division in the SWP with no water storage facilities. All deliveries are made from the aqueduct and are summarized in Appendix I, Table 20, pages 58 to 65.

Pumping Plants

Pumping plants in the San Joaquin Field Division include Las Perillas and Badger Hill on the Coastal Aqueduct, and Buena Vista, Wheeler Ridge, Ira J. Chrisman, and A.D. Edmonston on the California Aqueduct. A complete monthly summary of amounts pumped at all of these plants is shown on Table 1 on page 2. A summary of energy used to pump at each plant is shown on Table 4 on page 21.

Just over 2.9 million AF (2,753,271 AF State inflow and 172,656 AF Federal inflow) of project water flowed past Check 21 into San Joaquin Field Division during 1989. Approximately 1.3 million AF was pumped south by A.D. Edmonston.

Southern Field Division

Water Storage

There are five storage reservoirs in the Southern Field Division with a combined capacity of 717,251 AF. Combined storage at the beginning of the year was 628,362 AF. End of year combined storage was 571,136 AF. Complete monthly operation tables for all five reservoirs along with historical inflow and storage data for the last ten years is summarized on pages 48 through 56.

Water Deliveries

SWP deliveries in the Southern Field Division totaled 1,335,541 AF. Fourteen agencies received the water which was nearly all entitlement water. The only exceptions were 7,490 AF of recreation water to L.A. County Recreation Department and 10 AF sold to Lilico Pictures. Metropolitan Water District of Southern California received the largest single total delivery for 1989 from the SWP at 1,156,698 AF. In order to meet all deliveries, 35,000 AF of storage withdrawals were required.

Pumping and Generating Plants

Pumping plants in the Southern Field Division include Oso on the West Branch, and Pearblossom on the East Branch. Just over 1.3 million AF of SWP water was pumped into the Southern Field Division in 1989. A complete monthly summary of amounts pumped is shown on Table 1 on page 2. A summary of energy used to pump and station service energy at each plant is shown on Table 4 on page 21.

Generating plants include William E. Warne and Castaic (a pump-generating plant owned and operated within DWR water constraints by LADWP) on the West Branch, and Alamo and Devil Canyon on the East Branch. Energy available from each generating plant is summarized in Table 3 on page 17. Combined generation at all four plants totaled 1,708,247 MWh.

**SUMMARY OF
AQUEDUCT OPERATIONS**

APPENDIX I

**TABLE 20: SUMMARY OF GOVERNOR EDMUND
1989**

(in acre-feet)

DESCRIPTION	JAN	FEB	MAR	APR	MAY	JUN
DELTA FIELD DIVISION						
Note: North Bay Aqueduct, South Bay Aqueduct, and Lake Del Valle they are shown here						
North Bay Aqueduct						
Pumped at Barker Slough Pumping Plant	1,871	1,456	1,392	1,663	2,873	3,288
Delivery (Travis Turnout)	5	3	3	0	0	0
Pumped at Cordelia Pumping Plant	1,613	1,386	1,390	1,587	2,788	3,183
Deliveries	1,756	1,388	1,394	1,580	2,784	3,188
Change in Storage, Napa Terminal Tank	-3	-2	-4	7	4	-5
Computed Losses (-), Gains (+)	-113	-67	1	-76	-85	-105
California Aqueduct						
Pumped at Harvey O. Banks Delta Pumping Plant	361,209	219,702	370,614	375,072	184,079	119,981
Pumped at South Bay Pumping Plant	8,704	11,536	17,037	17,164	17,391	16,902
Delivered to Contracting Agencies	11	391	323	810	733	1,101
Change in Storage	17	67	-155	1,453	-1,068	114
Outflow at Check 12	349,256	205,938	350,457	353,044	164,955	99,490
Computed Losses (-), Gains (+)	-3,221	-1,770	-2,952	-2,601	-2,068	-2,374
South Bay Aqueduct						
Pumped at South Bay Pumping Plant	8,704	11,536	17,037	17,164	17,391	16,902
Inflow from Lake Del Valle	0	0	0	0	159	0
Outflow (Pumped into Lake Del Valle)	0	2,174	4,841	2,478	1,698	0
Outflow, Deliveries	8,374	9,013	11,202	14,533	15,842	16,892
Outflow, Natural Inflow Exchanged	318	339	984	143	0	0
Computed Losses (-), Gains (+)	-12	-10	-10	-10	-10	-10
Lake Del Valle Operation:						
Natural inflow	318	339	984	143	-23	-4
Inflow from South Bay Aqueduct	0	2,174	4,841	2,478	1,698	0
Releases to South Bay Aqueduct	0	0	0	0	159	0
Delivered to EBRP District	3	5	7	8	15	20
End-of-Month Storage (State)	25,462	27,924	33,653	36,067	37,282	36,897
Change in Storage	272	2,462	5,729	2,414	1,215	-385
Evaporation Losses	-43	-46	-89	-199	-286	-361
SAN LUIS FIELD DIVISION						
O'Neill Forebay (Including Pool 13)						
End-of-Month Storage	39,398	48,334	47,388	46,206	43,437	50,086
Inflow, California Aqueduct	349,256	205,938	350,457	353,044	164,955	99,490
Inflow, O'Neill P.- G. Plant	218,957	137,746	157,534	63,803	2,693	295
Inflow, Gianelli P.- G. Plant	0	79,574	2,662	65,694	230,789	595,475
Delivered to Federal Customers	429	2,225	1,037	3,234	3,663	4,485
Delivered to Dept. of Fish and Game (State)	0	0	0	28	0	0
Delivered to Dept. of Parks and Rec. (Federal)	0	1	2	5	8	10
Delivered to Dept. of Parks and Rec. (State)	0	1	1	6	11	13
Outflow, O'Neill P.- G. Plant	0	0	0	656	27,801	69,343
Outflow, Gianelli P.- G. Plant	350,688	117,370	300,618	124,846	0	0
Outflow, Dos Amigos P.P.	228,316	295,322	212,216	351,908	368,661	608,848
Change in Storage	-11,381	8,936	-946	-1,182	-2,769	6,649
Computed Losses (-), Gains (+)	-161	597	2,275	-3,040	-1,062	-5,912
San Luis Reservoir Operation						
State End-of-Month Storage	463,761	520,637	708,418	824,034	754,217	455,476
Total End-of-Month Storage	1,180,796	1,209,118	1,491,534	1,529,993	1,276,306	671,333
Inflow, Gianelli P.- G. Plant	350,688	117,370	300,618	124,846	0	0
Outflow, Gianelli P.- G. Plant	0	79,574	2,662	65,694	230,789	595,475
Pacheco Tunnel Diversion	11,508	5,971	5,368	15,805	19,540	17,775
Change in Storage (Total)	326,743	28,322	282,416	38,459	-253,687	-604,973
Computed Losses (-), Gains (+)	-12,437	-3,503	-10,172	-4,888	-3,358	8,277

Chlorpyrifos	0.01	Phorate	0.01
DCPA	0.01	Phosalone	0.02
DDD, DDE, DDT	0.01	Phosmet	0.02
Dichloran	0.01	Profenofos	0.01
Dicofol	0.01	s,s,s-Tributyl Phosphorotrithioate (DEF)	0.01
Dieldrin	0.01	PURGEABLE ORGANICS	
Diuron	0.05	1,1,1-Trichloroethane	0.50
Endosulfan Sulfate	0.01	1,1,2-Trichloroethane	0.50
Endosulfan (I,II)	0.01	1,1-Dichloroethane	0.50
Endrin	0.01	1,1-Dichloroethylene	0.50
Endrin Aldehyde	0.01	1,2-Dichloroethane	0.50
Heptachlor	0.01	1,2-Dichlorobenzene	0.50
Heptachlor Epoxide	0.01	1,2-Dechloropropane	0.50
Methoxychlor	0.01	1,3-Dechlorobenzene	0.50
PCB (various isomers)	0.10	1,4-Dechlorobenzene	0.50
PCNB	0.01	Benzene	0.50
Simazine	0.02	Bromodichloromethane	0.50
Thiobencarb	0.02	Bromoform	0.50
Toxaphene	0.20	Carbon tetrachloride	0.50
HERBICIDES		Chlorobenzene	0.50
2,4, - D	0.10	Chloroform	0.50
2,4 - DB	0.10	cis-1,2-Dechloroethylene	0.50
2,4,5 - TP	0.10	Dibromochloromethane	0.50
2,4,5 - T	0.10	Ethytibenzene	0.50
Dicamba	0.10	Tetrachloroethylene	0.50
MCPA	0.10	Toluene	0.50
MCPP	0.10	trans-1,2-Dichloroethylene	0.50
Pentachlorophenol (PCP)	0.10	Trichloroethylene	0.50
MISC. PESTICIDES		Trichlorofluoromethane	0.50
Acephate	0.10	Vinyl chloride	0.50
Aminomethylphosphonic	100.00	Xylene (s) 1	0.50

*Listed are those pesticides that would be detected by lab scans currently used for pesticide analysis, and the minimum concentration at which these substances can be detected. Detected amounts from the quarterly sampling program are shown below:

PESTICIDES IN THE CALIFORNIA AQUEDUCT

	1989			
STATION	FEB	MAY	AUG	NOV
HARVEY O. BANKS DELTA PUMPING PLANT				
Chlorinated Hydrocarbons	None Detected		Sample not collected this month.	None Detected
Atrazine		0.49		
Simazine		0.34		
O'NEILL PUMPING PLANT DISCHARGE				
Chlorinated Hydrocarbons		None Detected		None Detected
Simazine	0.18			
NEAR KETTLEMAN CITY (CHECK 21)				
Chlorinated Hydrocarbons		None Detected		None Detected
Diazinon	0.13 A/			
TEHACHAPI AFTERBAY				
Chlorinated Hydrocarbons				
Simazine	0.11	None Detected		
2,4-D				0.2 B/
